**INTRODUCTION**

## 2.1 Instrument

```
class pysat.Instrument (platform=None, name=None, tag=None, clean_level='clean', up-  
date_files=False, pad=None, orbit_info=None, inst_module=None, *arg,  
**kwargs)
```

Download, load, manage, modify and analyze science data.

### Parameters

- **platform** (*string*) – name of platform/satellite.
- **name** (*string*) – name of instrument.
- **tag** (*string, optional*) – identifies particular subset of instrument data.
- **inst\_module** (*module, optional*) – Provide instrument module directly (takes precedence over platform/name)
- **clean\_level** (*{'clean','dusty','dirty','none'}, optional*) – level of data quality
- **pad** (*pandas.DateOffset, or dictionary, optional*) – length of time to pad the begining and end of loaded data for time-series processing. Extra data is removed after applying all custom functions. Dictionary, if supplied, is simply passed to pandas DateOffset.
- **orbit\_info** (*dict*) – Orbit information, { 'index':index, 'kind':kind, 'period':period }. See pysat.Orbits for more information.
- **update\_files** (*boolean, optional*) – if True, query filesystem for instrument files and store. files.get\_new() will return no files after this call until additional files are added.

### data

*pandas.DataFrame*

loaded science data

### date

*pandas.datetime*

date for loaded data

### yr

*int*

year for loaded data

### bounds

*(datetime/filename/None, datetime/filename/None)*

bounds for loading data, supply array\_like for a season with gaps

**doy***int*

day of year for loaded data

**files***pysat.Files*

interface to instrument files

**meta***pysat.Meta*

interface to instrument metadata, similar to netCDF 1.6

**orbits***pysat.Orbits*

interface to extracting data orbit-by-orbit

**custom***pysat.Custom*

interface to instrument nano-kernel

**kwargs***dictionary*keyword arguments passed to instrument loading routine, `platform_name.load`**Notes**

pysat attempts to load the module `platform_name.py` located in the `pysat/instruments` directory. This module provides the underlying functionality to download, load, and clean instrument data. Alternatively, the module may be supplied directly using keyword `inst_module`.

**Examples**

```
# 1-second mag field data
vefi = pysat.Instrument(platform='cnofs', name='vefi', tag='dc_b',
                        clean_level='clean')
start = pysat.datetime(2009,1,1)
stop = pysat.datetime(2009,1,2)
vefi.download(start, stop)
vefi.load(date=start)
print vefi['dB_mer']
print vefi.meta['db_mer']

# 1-second thermal plasma parameters
ivm = pysat.Instrument(platform='cnofs', name='ivm', tag='', clean_level='clean')
ivm.download(start, stop)
ivm.load(2009,1)
print ivm['ionVelmeridional']

# Ionosphere profiles from GPS occultation
cosmic = pysat.Instrument('cosmic2013', 'gps', 'ionprf', altitude_bin=3)
# bins profile using 3 km step
cosmic.download(start, stop, user=user, password=password)
cosmic.load(date=start)
```

## Attributes

---

*bounds* Boundaries for iterating over instrument object by date or file.

---

## Methods

---

`__getitem__` (*key*)

Convenience notation for accessing data; obtain `inst.data.name` using `inst['name']`.

### Examples

**By position :** `inst[row index, 'name']`

**Slicing by row :** `inst[row1:row2, 'name']`

**By Date :** `inst[datetime, 'name']`

**Slicing by date** [(inclusive)] `inst[datetime1:datetime2, 'name']`

**Slicing by name and row/date :** `inst[datetime1:datetime1, 'name1':'name2']`

`__iter__` ()

Iterates the instrument object by loading subsequent days or files as appropriate.

Limits of iteration, and iteration type (date/file) set by *bounds* attribute.

`__setitem__` (*key, new*)

Convenience method for adding data to instrument.

### Examples

**Simple Assignment :** `inst['name'] = newData`

**Assignment with Metadata :** `inst['name'] = {'data':new_data, 'long_name':long_name, 'units':units}`

---

**Note:** If no metadata provided and if metadata for 'name' not already stored then default meta information is also added, `long_name = 'name'`, and `units = ''`.

---

## **bounds**

Boundaries for iterating over instrument object by date or file.

### Parameters

- **start** (*datetime object, filename, or None (default)*) – start of iteration, if None uses first data date. list-like collection also accepted
- **end** (*datetime object, filename, or None (default)*) – end of iteration, inclusive. If None uses last data date. list-like collection also accepted

---

**Note:** both start and stop must be the same type (date, or filename) or None

---

**copy()**

Deep copy of the entire Instrument object.

**download**(*start, stop, user=None, password=None*)

Download data for given Instrument object.

#### Parameters

- **start** (*pandas.datetime*) – start date to download data
- **stop** (*pandas.datetime*) – stop date to download data
- **user** (*string*) – username, if required by instrument data archive
- **password** (*string*) – password, if required by instrument data archive

**load**(*yr=None, doy=None, date=None, fname=None, fid=None, verifyPad=False*)

Loads data for a chosen instrument into `.data`. Any functions chosen by the user and added to the custom processing queue (`.custom.add`) are automatically applied to the data before it is available to user in `.data`.

#### Keyword Arguments

- **yr** (*integer*) – year for desired data
- **doy** (*integer*) – day of year
- **date** (*datetime object*) – date to load
- **fname** (*'string'*) – filename to be loaded
- **verifyPad** (*boolean*) – if True, padding data not removed (debug purposes)

**next()**

Manually iterate through the data loaded in satellite object.

Bounds of iteration and iteration type (day/file) are set by *bounds* attribute

---

**Note:** If there were no previous calls to load then the first day (default)/file will be loaded.

---

**prev()**

Manually iterate backwards through the data loaded in satellite object.

Bounds of iteration and iteration type (day/file) are set by *bounds* attribute

---

**Note:** If there were no previous calls to load then the first day (default)/file will be loaded.

---

**to\_netcdf3**(*fname=None*)

Stores loaded data into a netCDF3 64-bit file.

Stores 1-D data along dimension 'time' - the date time index. Stores object data (dataframes within dataframe) separately:

**The name of the object data is used to prepend extra variable** dimensions within netCDF, `key_2`, `key_3`, first dimension time

The index organizing the data stored as `key_sample_index` from `to_netcdf3` uses this naming scheme to reconstruct data structure

**The datetime index is stored as 'UNIX time'. netCDF-3 doesn't support** 64-bit integers so it is stored as a 64-bit float. This results in a loss of datetime precision when converted back to datetime index up to hundreds of nanoseconds. Use netCDF4 if this is a problem.

All attributes attached to instrument meta are written to netCDF attrs.

## 2.2 Custom

**class** `pysat.Custom`

Applies a queue of functions when `instrument.load` called.

Nano-kernel functionality enables instrument objects that are ‘fire and forget’. The functions are always run whenever the instrument load routine is called so instrument objects may be passed safely to other routines and the data will always be processed appropriately.

### Examples

```
def custom_func(inst, opt_param1=False, opt_param2=False):
    return None
instrument.custom.add(custom_func, 'modify', opt_param1=True)

def custom_func2(inst, opt_param1=False, opt_param2=False):
    return data_to_be_added
instrument.custom.add(custom_func2, 'add', opt_param2=True)
instrument.load(date=date)
print instrument['data_to_be_added']
```

**See also:**

`Custom.add`

### Notes

User should interact with Custom through `pysat.Instrument` instance’s attribute, `instrument.custom`

### Methods

---

**add** (*function*, *kind*='add', *at\_pos*='end', *\*args*, *\*\*kwargs*)

Add a function to custom processing queue.

Custom functions are applied automatically to associated pysat instrument whenever `instrument.load` command called.

#### Parameters

- **function** (*string or function object*) – name of function or function object to be added to queue
- **kind** ({'add', 'modify', 'pass'}) –
  - add** : Adds data returned from function to instrument object. A copy of pysat instrument object supplied to routine.
  - modify** : pysat instrument object supplied to routine. Any and all changes to object are retained.
  - pass** : A copy of pysat object is passed to function. No data is accepted from return.

- **at\_pos** (*string or int*) – insert at position. (default, insert at end).

### Notes

Allowed *add* function returns :

- {'data' : pandas Series/DataFrame/array\_like, 'units' : string/array\_like of strings, 'long\_name' : string/array\_like of strings, 'name' : string/array\_like of strings (iff data array\_like)}
- pandas DataFrame, names of columns are used
- pandas Series, .name required
- (string/list of strings, numpy array/list of arrays)

**clear()**

Clear custom function list.

## 2.3 Files

**class** `pysat.Files` (*sat*)

Maintains collection of files for instrument object.

Uses the `list_files` functions for each specific instrument to create an ordered collection of files in time. Used by instrument object to load the correct files. Files also contains helper methods for determining the presence of new files and creating an ordered list of files.

**base\_path**

*string*

path to .pysat directory in user home

**start\_date**

*datetime*

date of first file, used as default start bound for instrument object

**stop\_date**

*datetime*

date of last file, used as default stop bound for instrument object

**data\_path**

*string*

path to the directory containing instrument files, `top_dir/platform/name/tag/`

### Notes

User should generally use the interface provided by a `pysat.Instrument` instance. Exceptions are the classmethod `from_os`, provided to assist in generating the appropriate output for an instrument routine.

### Examples

```

# convenient file access
inst = pysat.Instrument(platform=platform, name=name, tag=tag)
# first file
inst.files[0]

# files from start up to stop (exclusive on stop)
start = pysat.datetime(2009,1,1)
stop = pysat.datetime(2009,1,3)
print vefi.files[start:stop]

# files for date
print vefi.files[start]

# files by slicing
print vefi.files[0:4]

# get a list of new files
# new files are those that weren't present the last time
# a given instrument's file list was stored
new_files = vefi.files.get_new()

# search pysat appropriate directory for instrument files and
# update Files instance, knowledge not written to disk.
vefi.files.refresh()

# search pysat appropriate directory for files and store new list
vefi.files.refresh(store=True)
# running get_new will now return an empty list until
# additional files are introduced

```

## Methods

---

**classmethod from\_os** (*data\_path=None, format\_str=None, two\_digit\_year\_break=None*)

Produces a list of files and formats it for Files class.

### Parameters

- **data\_path** (*string*) – Top level directory to search files for. This directory is provided by pysat to the `instrument_module.list_files` functions as `data_path`.
- **format\_string** (*string with python format codes*) – Provides the naming pattern of the instrument files and the locations of date information so an ordered list may be produced.
- **two\_digit\_year\_break** (*int*) – If filenames only store two digits for the year, then ‘1900’ will be added for years  $\geq$  `two_digit_year_break`, and ‘2000’ will be added for years  $<$  `two_digit_year_break`.

### Notes

Does not produce a Files instance, but the proper output from `instrument_module.list_files` method.

**get\_file\_array** (*start, end*)

Return a list of filenames between and including start and end.

### Parameters

- **start** (*array\_like or single string*) – filenames for start of returned filelist
- **stop** (*array\_like or single string*) – filenames inclusive end of list

**Returns**

- *list of filenames between and including start and end over all*
- *intervals.*

**get\_index** (*fname*)

Return index for a given filename.

**Parameters** **fname** (*string*) – filename**Notes**

If fname not found in the file information already attached to the instrument.files instance, then a files.refresh() call is made.

**get\_new** ()

List all new files since last time list was stored.

pysat stores filenames in the user\_home/.pysat directory. Returns a list of all new fileanmes since the last store. Filenames are stored if update\_files is True at instrument object level and if files.refresh(store=True) is called.

**Returns**

- *pandas Series of filenames*
- *False if no filenames*

**refresh** (*store=False*)

Refresh loaded instrument filelist by searching filesystem.

Searches pysat provided path, pysat\_data\_dir/platform/name/tag/, where pysat\_data\_dir is set by pysat.utils.set\_data\_dir(path=path).

**Parameters** **store** (*boolean*) – set True to store loaded file names into .pysat directory

## 2.4 Meta

**class** pysat.**Meta** (*metadata=None*)

Stores metadata for Instrument instance, similar to CF-1.6 netCDFdata standard.

**Parameters** **metadata** (*pandas.DataFrame*) – DataFrame should be indexed by variable name that contains at minimum the standard\_name (name), units, and long\_name for the data stored in the associated pysat Instrument object.

**data***pandas.DataFrame*

index is variable standard name, 'units' and 'long\_name' are also stored along with additional user provided labels.

**Methods**

`__getitem__` (*key*)

Convenience method for obtaining metadata.

Maps to pandas DataFrame.ix method.

### Examples

```
print meta['name']
```

`__setitem__` (*name, value*)

Convenience method for adding metadata.

### Examples

```
meta = pysat.Meta()
meta['name'] = {'long_name':string, 'units':string}
# update 'units' to new value
meta['name'] = {'units':string}
# update 'long_name' to new value
meta['name'] = {'long_name':string}
# attach new info with partial information, 'long_name' set to 'name2'
meta['name2'] = {'units':string}
# units are set to '' by default
meta['name3'] = {'long_name':string}
```

**classmethod** `from_csv` (*name=None, col\_names=None, sep=None, \*\*kwargs*)

Create instrument metadata object from csv.

#### Parameters

- **name** (*string*) – absolute filename for csv file or name of file stored in pandas instruments location
- **col\_names** (*list-like collection of strings*) – column names in csv and resultant meta object
- **sep** (*string*) – column separator for supplied csv filename

**Note:** column names must include at least ['name', 'long\_name', 'units'], assumed if col\_names is None.

**classmethod** `from_dict` ()

not implemented yet, load metadata from dict of items/list types

**classmethod** `from_nc` ()

not implemented yet, load metadata from netCDF

**replace** (*metadata=None*)

Replace stored metadata with input data.

**Parameters** **metadata** (*pandas.DataFrame*) – DataFrame should be indexed by variable name that contains at minimum the standard\_name (name), units, and long\_name for the data stored in the associated pysat Instrument object.

## 2.5 Orbits

**class** `pysat.Orbits` (*sat=None, index=None, kind=None, period=None*)

Determines orbits on the fly and provides orbital data in `.data`.

Determines the locations of orbit breaks in the loaded data in `inst.data` and provides iteration tools and convenient orbit selection via `inst.orbit[orbit num]`.

### Parameters

- **sat** (*pysat.Instrument instance*) – instrument object to determine orbits for
- **index** (*string*) – name of the data series to use for determining orbit breaks
- **kind** (*{‘local time’, ‘longitude’, ‘polar’}*) – kind of orbit, determines how orbital breaks are determined
  - local time: negative gradients in `lt` or breaks in `inst.data.index`
  - longitude: negative gradients or breaks in `inst.data.index`
  - polar: zero crossings in latitude or breaks in `inst.data.index`
- **period** (*np.timedelta64*) – length of time for orbital period, used to gauge when a break in the datetime index (`inst.data.index`) is large enough to consider it a new orbit

### Notes

class should not be called directly by the user, use the interface provided by `inst.orbits` where `inst = pysat.Instrument()`

### Examples

```
info = {'index': 'longitude', 'kind': 'longitude'}
vefi = pysat.Instrument(platform='cnofs', name='vefi', tag='dc_b',
                        clean_level=None, orbit_info=info)
start = pysat.datetime(2009,1,1)
stop = pysat.datetime(2009,1,10)
vefi.load(date=start)
vefi.bounds(start, stop)

# iterate over orbits
for vefi in vefi.orbits:
    print 'Next available orbit ', vefi['dB_mer']

# load fifth orbit of first day
vefi.load(date=start)
vefi.orbits[5]

# less convenient load
vefi.orbits.load(5)

# manually iterate orbit
vefi.orbits.next()
# backwards
vefi.orbits.prev()
```

## Methods

`__getitem__` (*key*)

Enable convenience notation for loading orbit into parent object.

### Example

```
inst.load(date=date)
inst.orbits[4]
print 'Orbit data ', inst.data
```

**Note:** A day of data must already be loaded.

`__iter__` ()

Support iteration by orbit.

For each iteration the next available orbit is loaded into inst.data.

### Example

```
for inst in inst.orbits:
    print 'next available orbit ', inst.data
```

`load` (*orbit=None*)

Load a particular orbit into .data for loaded day.

**Parameters = orbit number, 1 indexed** (*orbit*) –

**Note:** A day of data must be loaded before this routine functions properly. If the last orbit of the day is requested, it will automatically be padded with data from the next day. The orbit counter will be reset to 1.

`next` (*\*arg, \*\*kwarg*)

Load the next orbit into .data.

**Note:** Forms complete orbits across day boundaries. If no data loaded then the first orbit from the first date of data is returned.

`prev` (*\*arg, \*\*kwarg*)

Load the next orbit into .data.

**Note:** Forms complete orbits across day boundaries. If no data loaded then the last orbit of data from the last day is loaded into .data.

## 2.6 Utilities

`pysat.utils.create_datetime_index` (*year=None, month=None, day=None, uts=None*)

Create a timeseries index using supplied year, month, day, and ut in seconds.

**Parameters**

- **year** (*array\_like of ints*) –
- **month** (*array\_like of ints or None*) –
- **day** (*array\_like of ints*) – for day (default) or day of year (use month=None)
- **uts** (*array\_like of floats*) –

**Returns**

**Return type** Pandas timeseries index.

---

**Note:** Leap seconds have no meaning here.

---

`pysat.utils.getyrday(date)`

Return a tuple of year, day of year for a supplied datetime object.

`pysat.utils.load_netcdf3(fnames=None, strict_meta=False, index_label=None, unix_time=False, **kwargs)`

Load netCDF-3 file produced by pysat.

**Parameters**

- **fnames** (*string or array\_like of strings*) – filenames to load
- **strict\_meta** (*boolean*) – check if metadata across filenames is the same
- **index\_label** (*string*) – name of data to be used as DataFrame index
- **unix\_time** (*boolean*) – True if index\_label refers to UNIX time

`pysat.utils.season_date_range(start, stop, freq='D')`

Return array of datetime objects using input frequency from start to stop

Supports single datetime object or list, tuple, ndarray of start and stop dates.

freq codes correspond to pandas date\_range codes, D daily, M monthly, S secondly

`pysat.utils.set_data_dir(path=None)`

set the top level directory pysat uses to look for data.

## 2.7 Supported Instruments

### 2.7.1 C/NOFS VEFI

Supports the Vector Electric Field Instrument (VEFI) onboard the Communication and Navigation Outage Forecasting System (C/NOFS) satellite. Downloads data from the NASA Coordinated Data Analysis Web (CDAWeb).

**param tag**

**type tag** {'dc\_b'}

**Notes**

- tag = 'dc\_b': 1 second DC magnetometer data

**Warning:**

- Currently no cleaning routine.
- Module not written by VEFI team.

## 2.7.2 C/NOFS IVM

Supports the Ion Velocity Meter (IVM) onboard the Communication and Navigation Outage Forecasting System (C/NOFS) satellite, part of the Coupled Ion Natural Dynamics Investigation (CINDI). Downloads data from the NASA Coordinated Data Analysis Web (CDAWeb) in CDF format.

**param tag** No tags supported

**type tag** string

**Warning:**

- The sampling rate of the instrument changes on July 29th, 2010. The rate is attached to the instrument object as `.sample_rate`.
- The cleaning parameters for the instrument are still under development.

## 2.7.3 COSMIC 2013 GPS

Loads data from the COSMIC satellite, 2013 reprocessing.

The Constellation Observing System for Meteorology, Ionosphere, and Climate (COSMIC) are six satellites in LEO with GPS receivers. The occultation of GPS signals by the atmosphere provides a measurement of atmospheric parameters. Data downloaded from the COSMIC Data Analysis and Archival Center.

### Notes

- 'ionprf': 'ionPrf' ionosphere profiles
- 'sonprf': 'sonPrf' files
- 'wetprf': 'wetPrf' files
- 'atmPrf': 'atmPrf' files

**Warning:**

- Routine was not produced by COSMIC team

## 2.7.4 COSMIC GPS

Loads data from the COSMIC satellite.

**tags:** 'ionprf': 'ionPrf' ionosphere profiles 'sonprf': 'sonPrf' files 'wetprf': 'wetPrf' files 'atmPrf': 'atmPrf'
